

Energy Policy

The energy policy adopted by Treofan Germany GmbH & Co. KG sets out the organisation's commitment to achieving an improved energy-related performance and provides the framework for establishing its strategic and operational goals. The implementation of the energy policy will contribute towards the sustainable development of the company, while also serving as a foundation for improving energy efficiency through a reduction in specific energy consumption. The company is providing the necessary resources in order to achieve its strategic and operational objectives, while complying with and monitoring the applicable laws and regulations.

The following principles form the foundation for corporate behaviour:

- We are committed to improving our energy efficiency on an ongoing basis.
- We calculate our levels of energy consumption systematically and for each of our plants in order to evaluate them and use them to develop energy-saving concepts, as part of an ongoing process of improvement (PDCA).
- Energy flows are recorded in real time using a data capture system (Messdas). This allows us to conduct continual analysis of our consumption and efficiency.
- The issue of energy efficiency is taken into account as part of the procurement process for energy-related units, up to and including a whole new film unit.
- Due to regular maintenance carried out on the facilities, we have achieved a high success rate in terms of our targeted reduction in specific energy consumption.
- We actively support energy efficiency by evaluating our plans of action in a sustainable and consistent way.
- We support the acquisition of energy-efficient services and products that are intended to improve energy-related performance.
- We use our training programme to raise awareness and encourage our trainees to voluntarily change their attitudes towards energy conservation.
- By reducing our specific energy consumption, we are contributing to the environment by cutting down on greenhouse gas emissions.
- All of our employees undertake to apply the guidelines of our energy management system in an active fashion, with the aim of continually improving energy efficiency.
